

Data Reliability Audit

Prod canonical warehouse (wbasvhvismukaqdnouk) — full integrity review

✓ **VERDICT: The data is reliable.**

Date: June 01, 2026
Scope: ~30 checks — duplicates, referential integrity, provenance, nulls, cross-source coverage
Probe: scripts/probes/_db_reliability_audit.js

0 ORPHANS (every FK)	391 / 391 CLIENTS TRACEABLE	0 DUPLICATE CODES	0 OPEN ITEMS
--	---	---	------------------------------------

Why this was run

A cross-source duplicate client record was found (the same business held two rows in our database — one from the 4/29 Airtable backfill, one from Jobber). This audit verifies there is no broader corruption. Result: referential integrity is spotless, every client is traceable to a source, and the only two scary-looking counts (150 property “duplicates”, 454 source-less visits) are expected system patterns, not bad data. The two real issues found were fixed.

Checks that passed clean

Every foreign-key and identity check returned zero issues — nothing points at a row that doesn't exist, and no external id is split across two records.

INTEGRITY CHECK	ISSUES
Orphan visits → clients / properties / jobs / vehicles / invoices	✓ 0
Orphan manifest_visits → manifests / visits	✓ 0
Orphan properties / service_configs / gdos / client_locations / derm_manifests	✓ 0
Orphan entity_source_links → their targets	✓ 0
One Jobber gid or Airtable rec mapped to two client rows	✓ 0
One source id mapped to two entities (any type)	✓ 0
Null client name / visit date / visit client / manifest client	✓ 0
Within-client duplicate manifest # / GDO #	✓ 0

The 4 findings

Two real issues (fixed) and two expected-by-design patterns.

FINDING	COUNT	VERDICT
Duplicate client_code	2 → 0	FIXED — 144-LTG (Airtable row merged into the Jobber row) + 172-NU (empty orphan removed). A cross-source merge gap from the 4/29 backfill + later Jobber sync — NOT an Airtable duplicate.
Same client + same address, 2 property rows	150	BY DESIGN — 100% are the Jobber billing-address vs service-address split (one row flagged is_billing). Not corruption.
Visits with no source link	454	BY DESIGN — 100% are source = supabase_cron — the upcoming visits our own generator creates. Every externally-sourced visit IS traceable.
Clients with no source link	3 → 0	FIXED — 1 was the dup orphan (removed); the other 2 (050-PV, 150-KOS) had their Airtable source links backfilled. Every client is now traceable.

Root cause & prevention

The 4/29 Airtable backfill created client rows; a later Jobber sync then made a SECOND row for the same client instead of matching it (it matched on Jobber gid, which the Airtable-born row didn't carry). Only 2 slipped through. The Airtable-sunset wipe + repopulate (Jobber-canonical) closes this path entirely; until then, the duplicate-code check in the audit probe catches any new occurrence.
